

DrenchSmart is a faecal egg count reduction test that assesses drench efficacy on your property. It's suitable for sheep and goats.

Why do I need it?

DrenchSmart provides a property drench status report so that you can make informed drench selection decisions. Making the best decisions can delay the onset of drench resistance, reduce your costs by eliminating unnecessary drenching, and increase your profitability because you can select only the drenches that are effective.

DrenchSmart can test the following drench actives for efficacy on your property:

- Benzimidazoles
- Levamisoles
- Combination (BZ and Lev)
- Abamectin
- Ivermectin (Half)
- Ivermectin (Full)
- Moxidectin

(A minimum of four drenches must be chosen with a maximum of seven. All assessments will have a control group).

Getting started

Getting started is easy. Just phone 0800 332 725 or email sales@fecpak.co.nz for no obligation advice on how DrenchSmart can help you make every drench count.

Once you get started, you will soon be making informed decisions and applying the right course of action.

DrenchSmart gives you foolproof testing with uncompromised results when you need them. So you can get on with the business of farming.

World leading technology

Informed decisions

Higher productivity

Save time and money on unnecessary drenching

Know if your drench is working effectively

Make every drench count

How can I use DrenchSmart?

DrenchSmart can assist you with:

- Removing the guesswork by knowing which drenches work on your property
- Increasing performance and profitability within your operation
- Ensuring longevity of drenches on your property by protecting the drugs that are working
- The development of effective quarantine protocols
- Property valuation

“DrenchSmart is a moment in time assessment of the drench status of your property”

Take the first step – it couldn't be easier

Step 1: Contact us to organise a DrenchSmart Assessment

Step 2: We sign the DrenchSmart agreement with you that ensures the confidentiality of your information.

Step 3: We will carry out a faecal egg count (FEC) test from your mob. This will be validated through our FECPAK laboratory to ensure that the FECs are high enough to start the DrenchSmart Assessment. FECs must be a minimum of 500 eggs per gram (epg), although it is recommended to be 700-800 epg.

Step 4: First sample collection

You need to supply 12 animals per drench group and the weigh equipment. We will do the rest to collect the samples and set up the assessment with a certified contractor.

Step 5: Final sample collection

10 days later your certified contractor will come back to take the final samples. All samples are then couriered to our laboratory for processing.

Step 6: You receive your DrenchSmart Report containing:

- Actual data - individual FEC count results and parasite species results will be included.
- Recommendations - FECPAK interpretation of the results will be produced.
- Parasite Species Identification - where possible resistant parasite species will be identified.
- Details of the DrenchSmart Protocols that were followed for your assessment.

DrenchSmart Assessments are only carried out by certified contractors through FECPAK International.

Contact FECPAK direct to arrange a DrenchSmart Assessment on your property today on 0800 332 725.
