

Quick and easy testing with the FECPAK unit

Because it is a complete 'on-the-spot' assessment tool for sheep, goats, cattle and horses, it gives you instant information unique to your farm, and valuable information.

The FECPAK unit gives you two types of data, individual testing and mob average testing.

Individual Testing which consists of taking individual samples and processing them, and gives you:

- Individual sample results
- Range of sample results across the animals tested

Mob Average Testing which consists of a composite sample collection so only one sample is processed.

This gives you:

- Mob average results – a statistical advantage
- Results in 10 minutes
- Ability to monitor a number of different mobs parasite output

Getting started

Getting started is easy. Just phone 0800 332 725 or email sales@fecpak.co.nz for no obligation advice on how the FECPAK system can help you make every drench count.

Once you get started, you will soon be making informed decisions by measuring your own results and applying the right course of action.

The FECPAK system gives you foolproof testing with uncompromised results when you need them. So you can get on with the business of farming.

Are parasites causing production losses on your property?

Is your current parasite management approach sustainable?

The FECPAK unit?

The FECPAK unit is a complete “on the spot” parasite assessment tool, for sheep, goats, cattle and horses which allows unique and instant information.

FECPAK unit benefits

- Instant FEC results
- No on-going costs
- Allows regular monitoring
- Simple to use
- Cost savings - financial and labour
- Full product backup
- Client support package (free audit service, tutorial DVD etc)
- Access to the latest technical information via “FECPAK Updates”

The FECPAK system is all about managing worms on your farm.

Parasites are a constantly changing issue, so regular FEC information assists you to gain an understanding of what factors can trigger a parasite problem.

The FECPAK system gives you quick results so you can make decisions based on sound evidence. The results are unique to your farm so you can take control with information.

By knowing when to drench, and drenching only when it's necessary to do so, you can save yourself time and money.

Why drench?

There are a number of reasons for drenching – production losses, quarantine drenching or because your pastures are being polluted by high FEC outputs - but the main outcome you'll be looking for is increased productivity which comes from animals not fighting a worm burden.

The ability to regularly monitor FEC levels means you can develop unique management strategies for your farm. You'll spend less time and money on worm control, and you can get on with the business of farming.

What is the FECPAK system?

The FECPAK system is the integration of FEC information combined with operational and worm knowledge that means you can drench your animals only when they need it – not when you think they need it.

Worms – “The damage is done when they come over the tongue. By reducing FEC pollution on pasture, animals consume less larvae = higher productivity and less drenching.
